

WIWE | Portable ECG Device | Mobile EKG Monitor - White

£289.99

Product Code: DSW0001

Overview

WIWE is a risk assessment device that can help predict and prevent cases of stroke and Sudden Cardiac Arrest (SCA)

The credit card sized device measures blood oxygen (SP02) and heart rate, and then analyses that information via the free Wiwe app (Available on iOS 8.1+ and Android 5.0+) in order to warn users of any potential warning signs. This allows potential at-risk individuals to monitor themselves without the need for medical professionals, providing safety and self confidence.

It's a sad truth that most cases of SCA result in death within minutes. By identifying warning signs effectively and quickly, Wiwe hopes to change these shocking statistics for the better.

WIWE - A message from the heart. If we know about it, we can change it.

Here is a recent review on the WIWE written by Dr. Kenan Raddawi, an e-health expert at Medgadget, a leading independent medical technology website; <https://www.medgadget.com/2017/05/wiwe-smartphone-powered-handheld-ecg-device-pulse-oximeter-products-review.html>

Features

The WIWE uses a worldwide unique intelligent algorithm which evaluates the properties of the ECG wave to calculate if there is a risk of afib-related stroke and sudden cardiac arrest. If we know about it, we can change it!

ECG Recording

One of the main features of WIWE is ECG recording. Throughout the analysis the outstanding noise filtering helps to get the best possible results.

The evaluation calls your attention to any possible abnormalities detected in your ECG wave.

Pulse oximeter (SpO2)

Healthy or sick? Blood oxygen level is a very important indicator, which can inflict moderate exhaustion, but there are many severe diseases caused by oxygen insufficiency.

Shows the road to a healthier life

The use of the pedometer function helps to reduce the risks related to heart diseases.

The WIWE has shortly upcoming features such as a meal planner and a calorie counter.

Stroke is the second leading cause of death worldwide! Anybody can be affected, because as we grow so does the risk of stroke. On top of that there are other risk factors: high blood pressure, high cholesterol, obesity, diabetes, cardiovascular

diseases, smoking & stress.

Sudden cardiac death can happen anytime without a sign. - Identifying these signs early could save lives!
